

# Protocol Architecture, TCP/IP, and Internet-Based Applications

# The Need For Protocol Architecture

**1.) the source must activate communications path or inform network of destination**

**2.) the source must make sure that destination is prepared to receive data**

**To transfer data  
several tasks  
must be  
performed:**

**3.) the file transfer application on source must confirm file management program at destination is prepared to accept and store file**

**4.) a format translation function may need to be performed if the formats on systems are different**

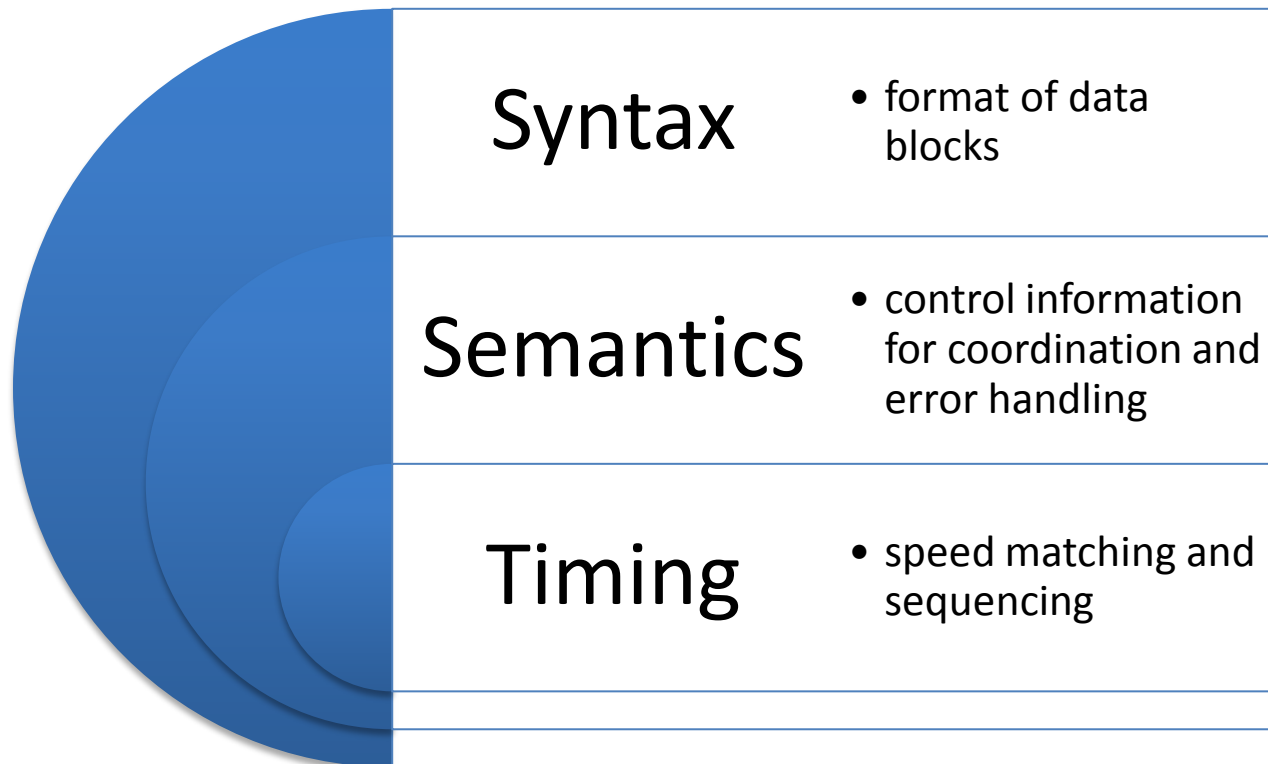

# Functions of Protocol Architecture

- breaks logic into subtask modules which are implemented separately
- modules are arranged in a vertical stack
  - each layer in the stack performs a subset of functions
  - relies on next lower layer for primitive functions
  - changes in one layer should not require changes in other layers

# Key Features of a Protocol

A protocol is a set of rules or conventions that allow peer layers to communicate.

The key features of a protocol are:

# A Simple Protocol

agents involved:

- applications
- computers
- networks

examples of applications include  
file transfer and  
electronic mail

these execute on  
computers that  
support multiple  
simultaneous  
applications

# Communication Layers

- communication tasks are organized into three relatively independent layers:
  - Network access layer
    - concerned with the exchange of data
  - Transport layer
    - provides reliable data transfer
  - Application layer
    - Contains logic to support applications

# Network Access Layer

- covers the exchange of data between an end system and the network that it is attached to
- concerned with issues like :
  - destination address provision
  - invoking specific services like priority
  - access to & routing data across a network for two end systems attached to the same network

# Transport Layer

concerned with  
providing  
reliable delivery  
of data

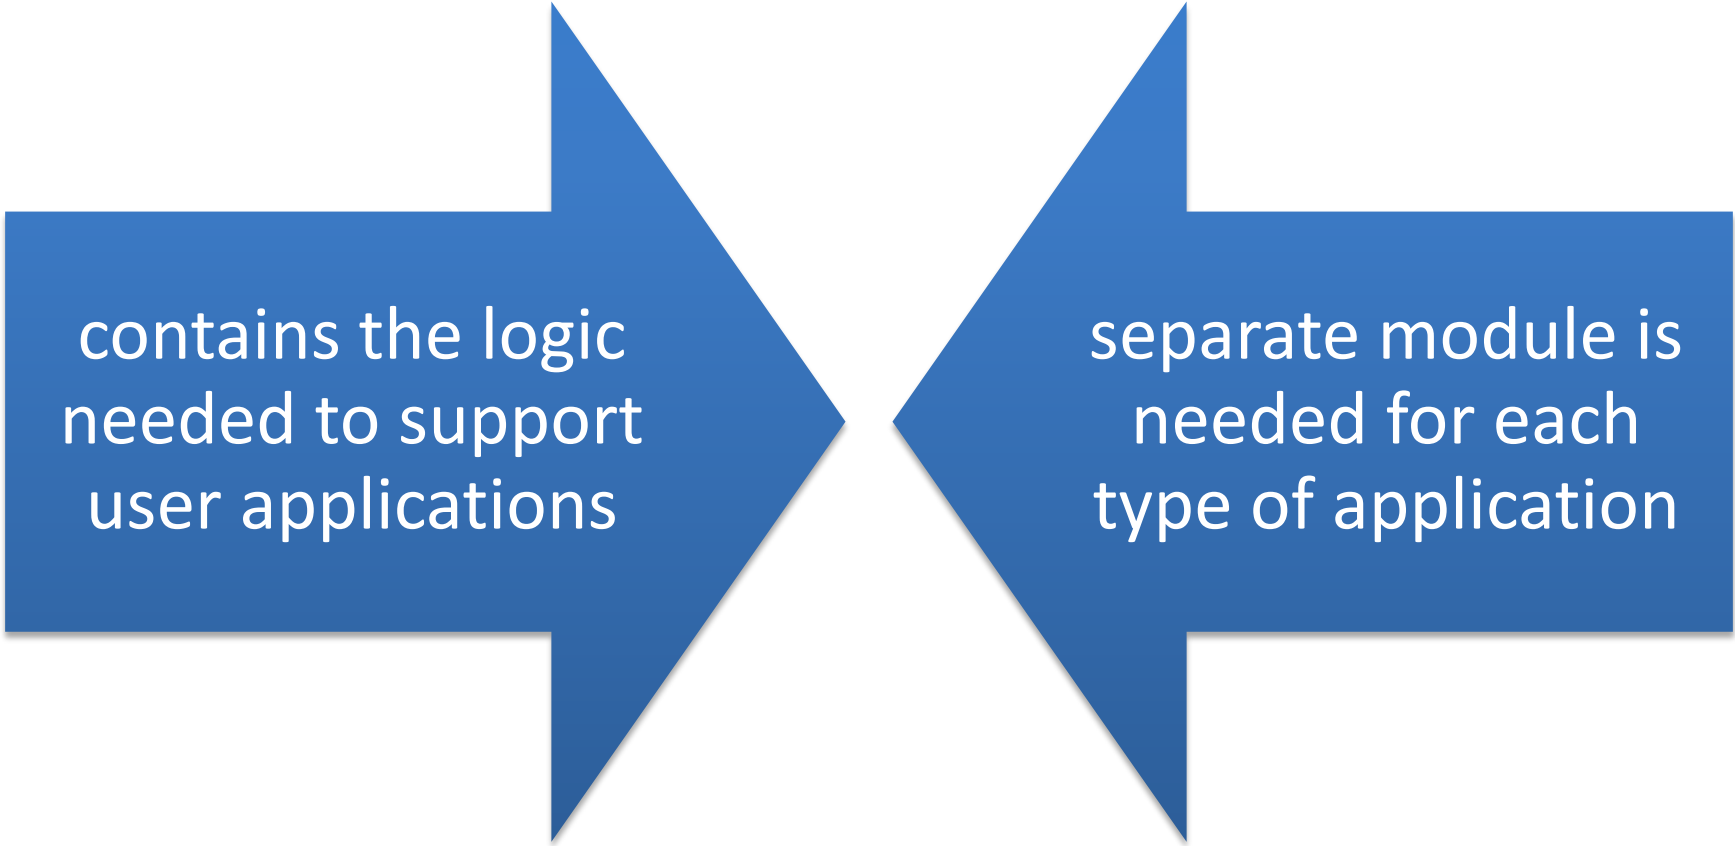

essentially  
independent of  
the nature of  
the applications

common layer  
shared by all  
applications

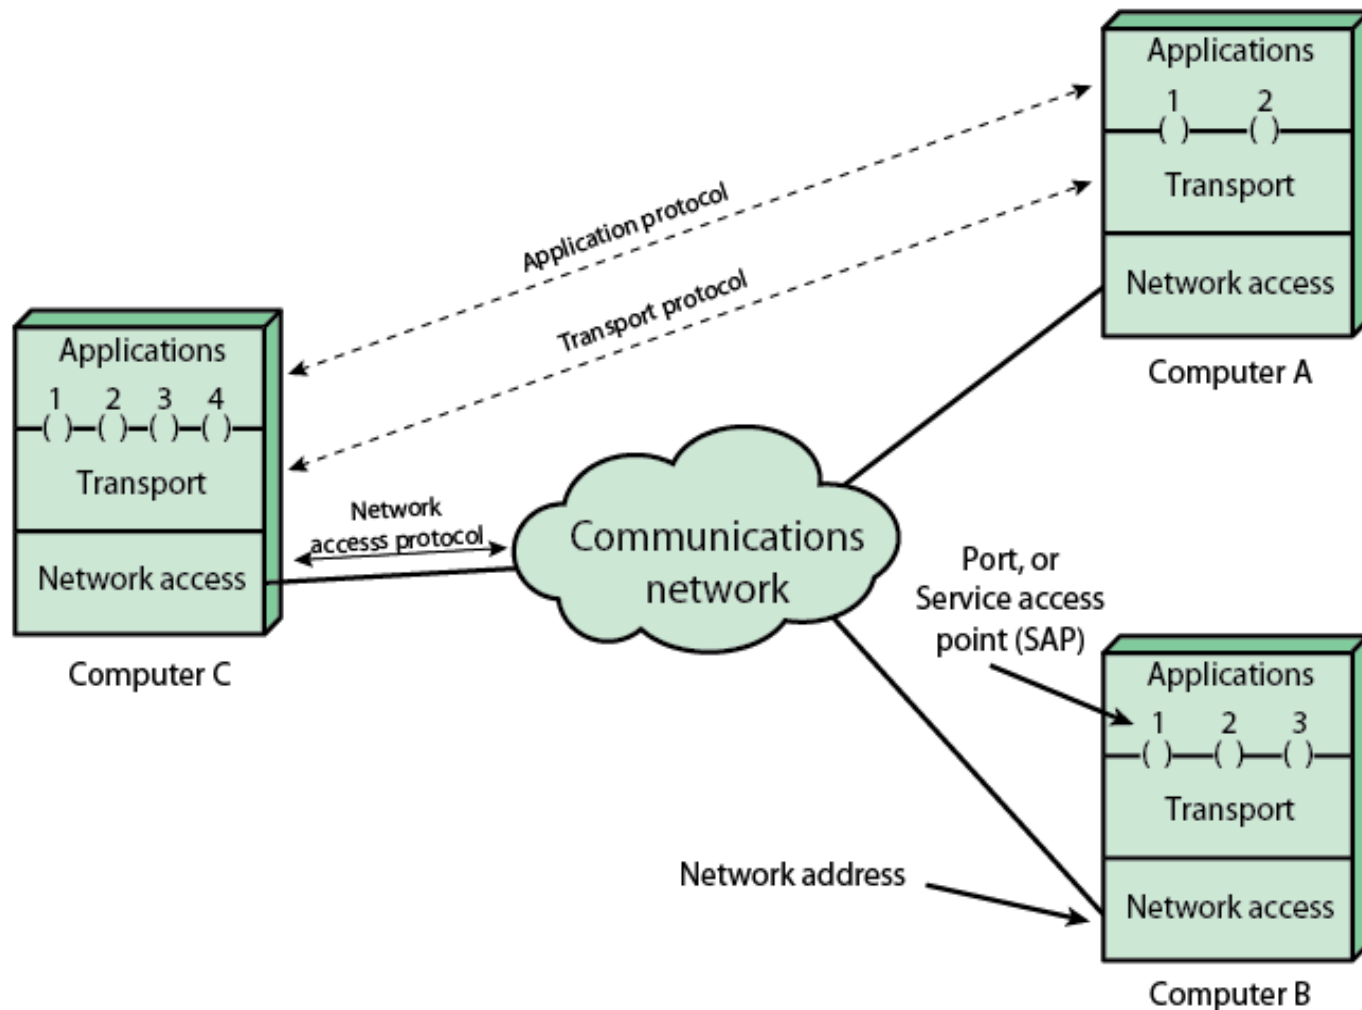

# Application Layer

contains the logic  
needed to support  
user applications

separate module is  
needed for each  
type of application

# Protocol Architecture and Networks

# Protocols in a Simplified Architecture

# Addressing

Two levels of addressing are needed:

each computer on the network has a unique network address

each application has an address that is unique with that computer (SAPs)

# Protocol Data Unit (PDU)

- the combination of data and control information is a protocol data unit (PDU)
- typically control information is contained in a PDU header
  - control information is used by the peer transport protocol at computer B
- headers may include:
  - source port, destination port, sequence number, and error-detection code

# Network Access Protocol

- after receiving segment from transport layer, the network access protocol must request transmission over the network
  - the network access protocol creates a network access PDU (packet) with control information
- header includes:
  - source computer address
  - destination computer address
  - facilities requests

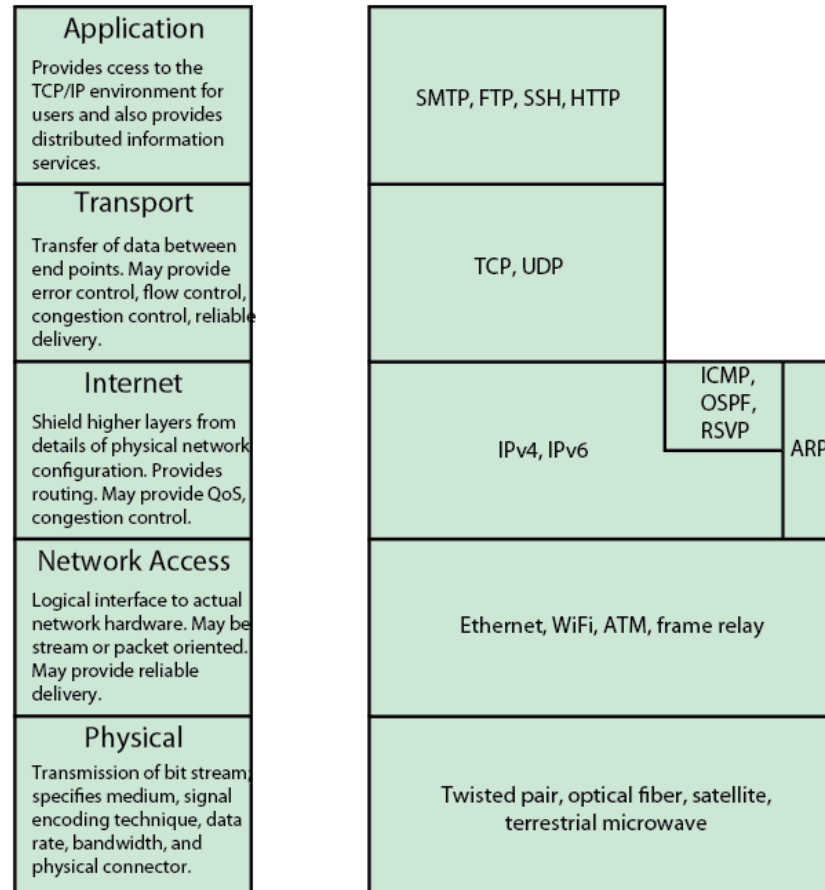

# TCP/IP Protocol Architecture

Result of  
protocol  
research and  
development  
conducted on  
ARPANET

Referred to as  
TCP/IP protocol  
suite

TCP/IP  
comprises a  
large collection  
of protocols  
that are  
Internet  
standards

# TCP/IP Layers and Example Protocols

# Physical Layer

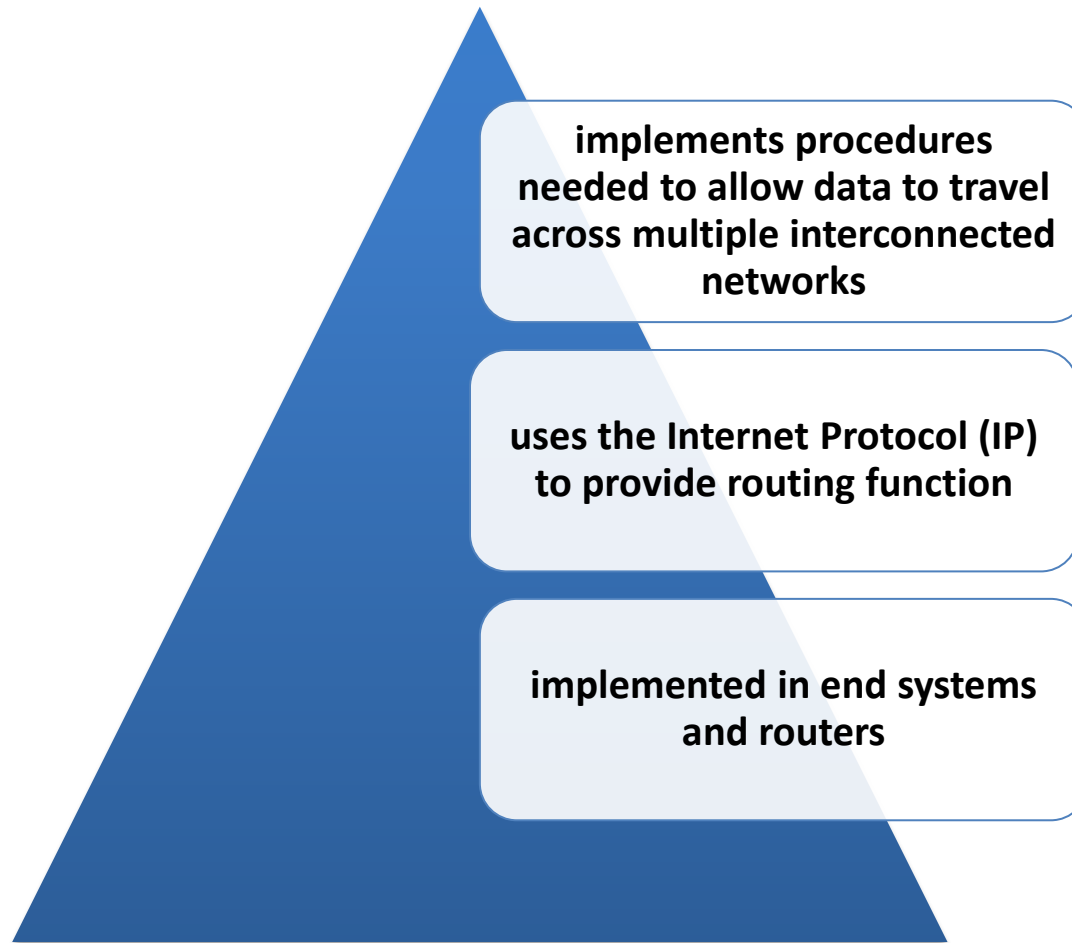

- covers the physical interface between computer and network
- concerned with issues like:
  - characteristics of transmission medium
  - nature of the signals
  - data rates

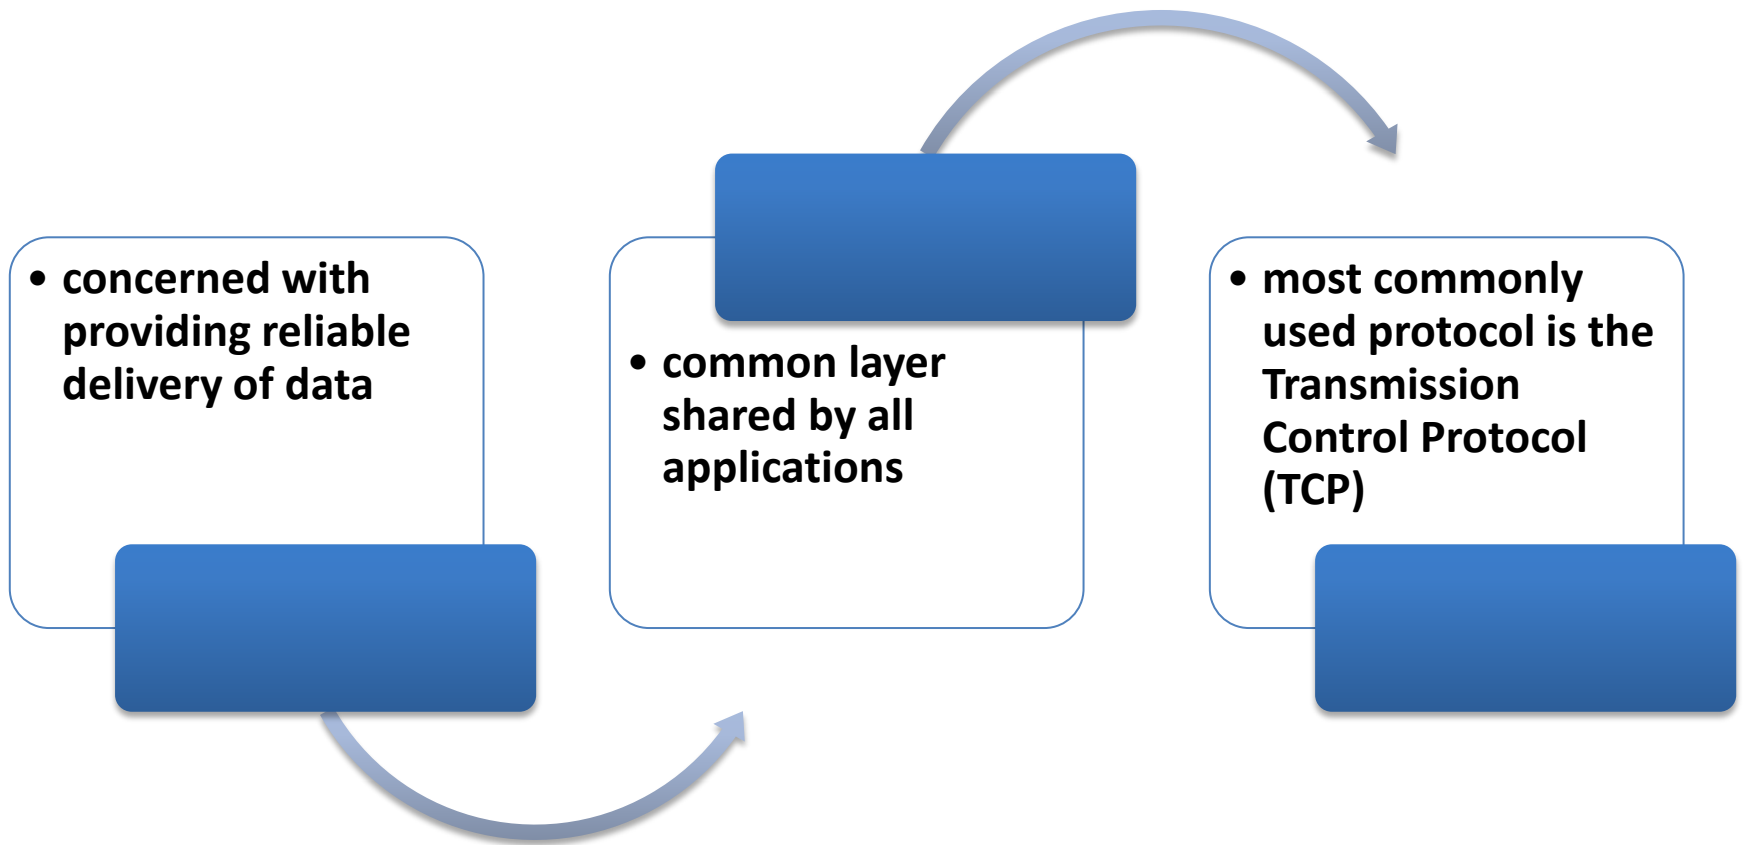

# Network Access Layer

- covers the exchange of data between an end system and the network that it is attached to
- concerned with issues like :
  - destination address provision
  - invoking specific services like priority
  - access to & routing data across a network for two end systems attached to the same network

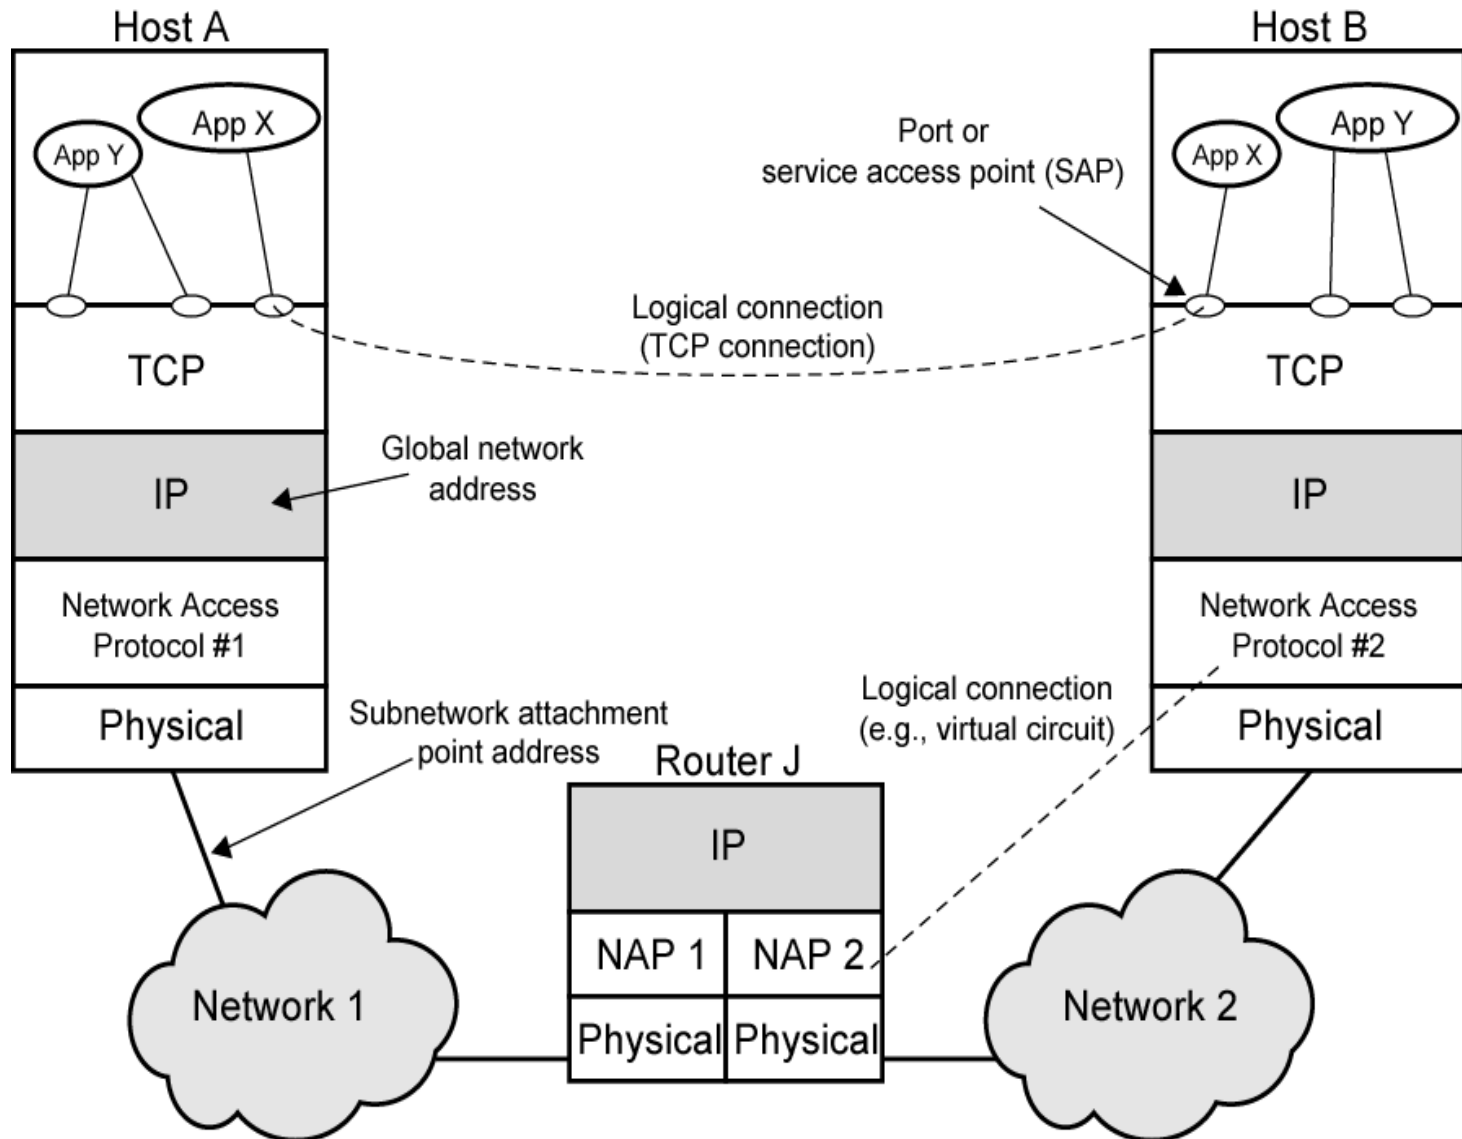

# Internet Layer

# Host-to-Host (Transport) Layer

# Operation of TCP/IP

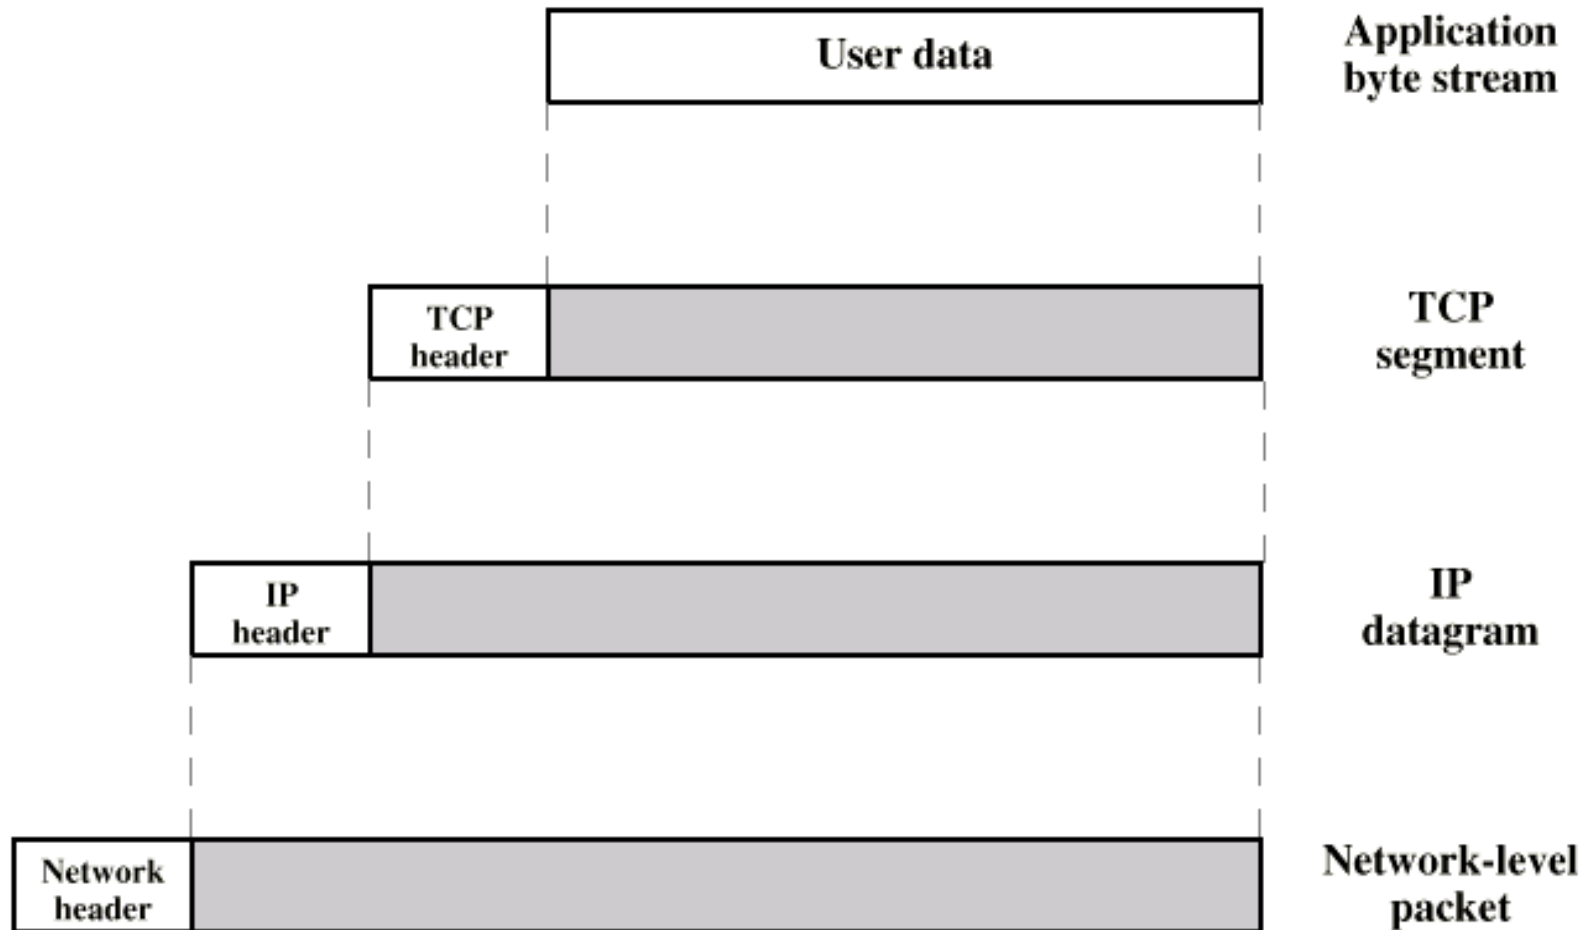

# TCP/IP Address Requirements

Two levels of addressing are needed:

each host on a subnetwork must have a unique global internet address

each process with a host must have an address (known as a port) that is unique within the host

# Operation of TCP/IP

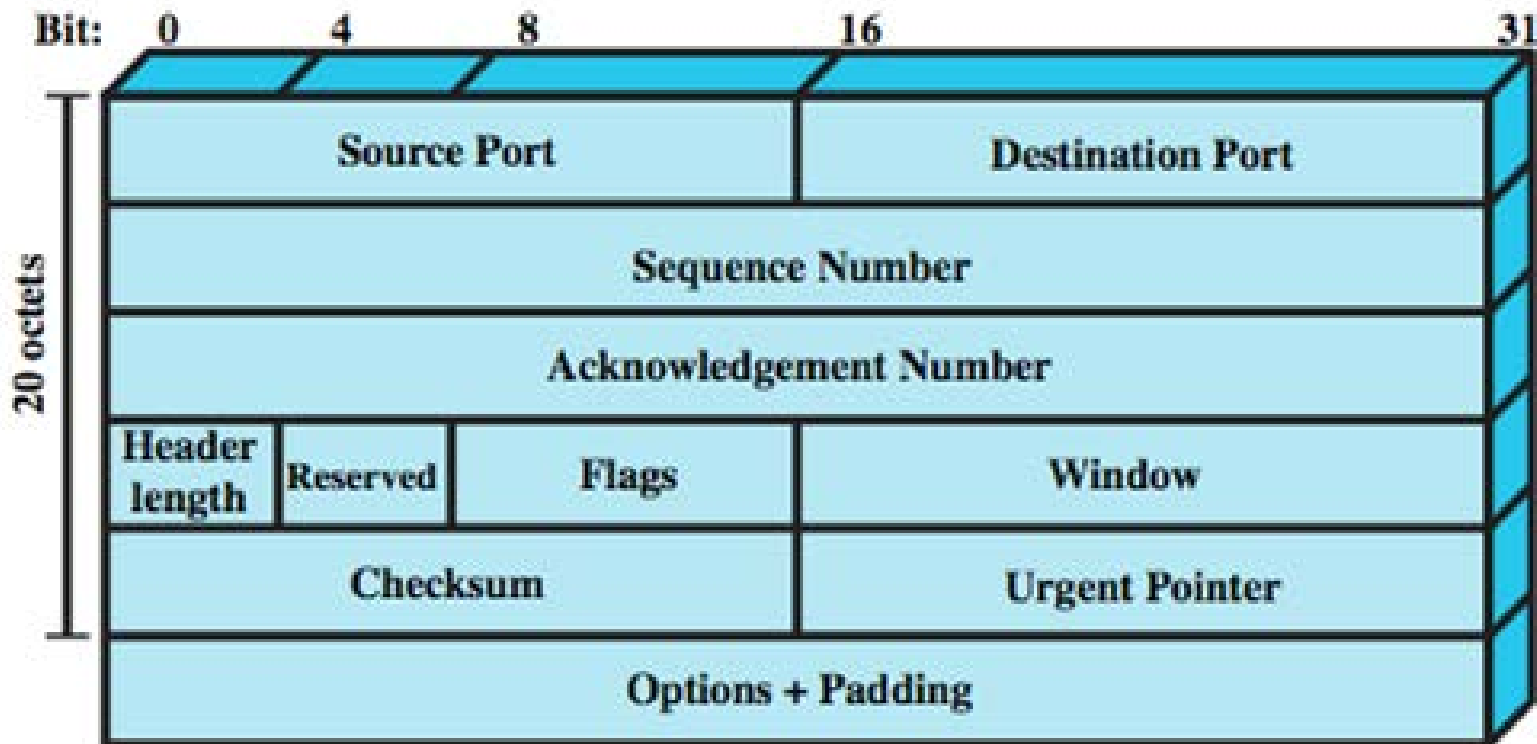

# Transmission Control Protocol (TCP)

- TCP is the transport layer protocol for most applications
- TCP provides a reliable connection for transfer of data between applications
- A TCP segment is the basic protocol unit
- TCP tracks segments between entities for duration of each connection

# TCP Header

(a) TCP Header

# User Datagram Protocol (UDP)

- alternative to TCP
- does not guarantee delivery, preservation of sequence, or protection against duplication
- adds port addressing capability to IP
- used with Simple Network Management Protocol (SNMP)

# UDP Header

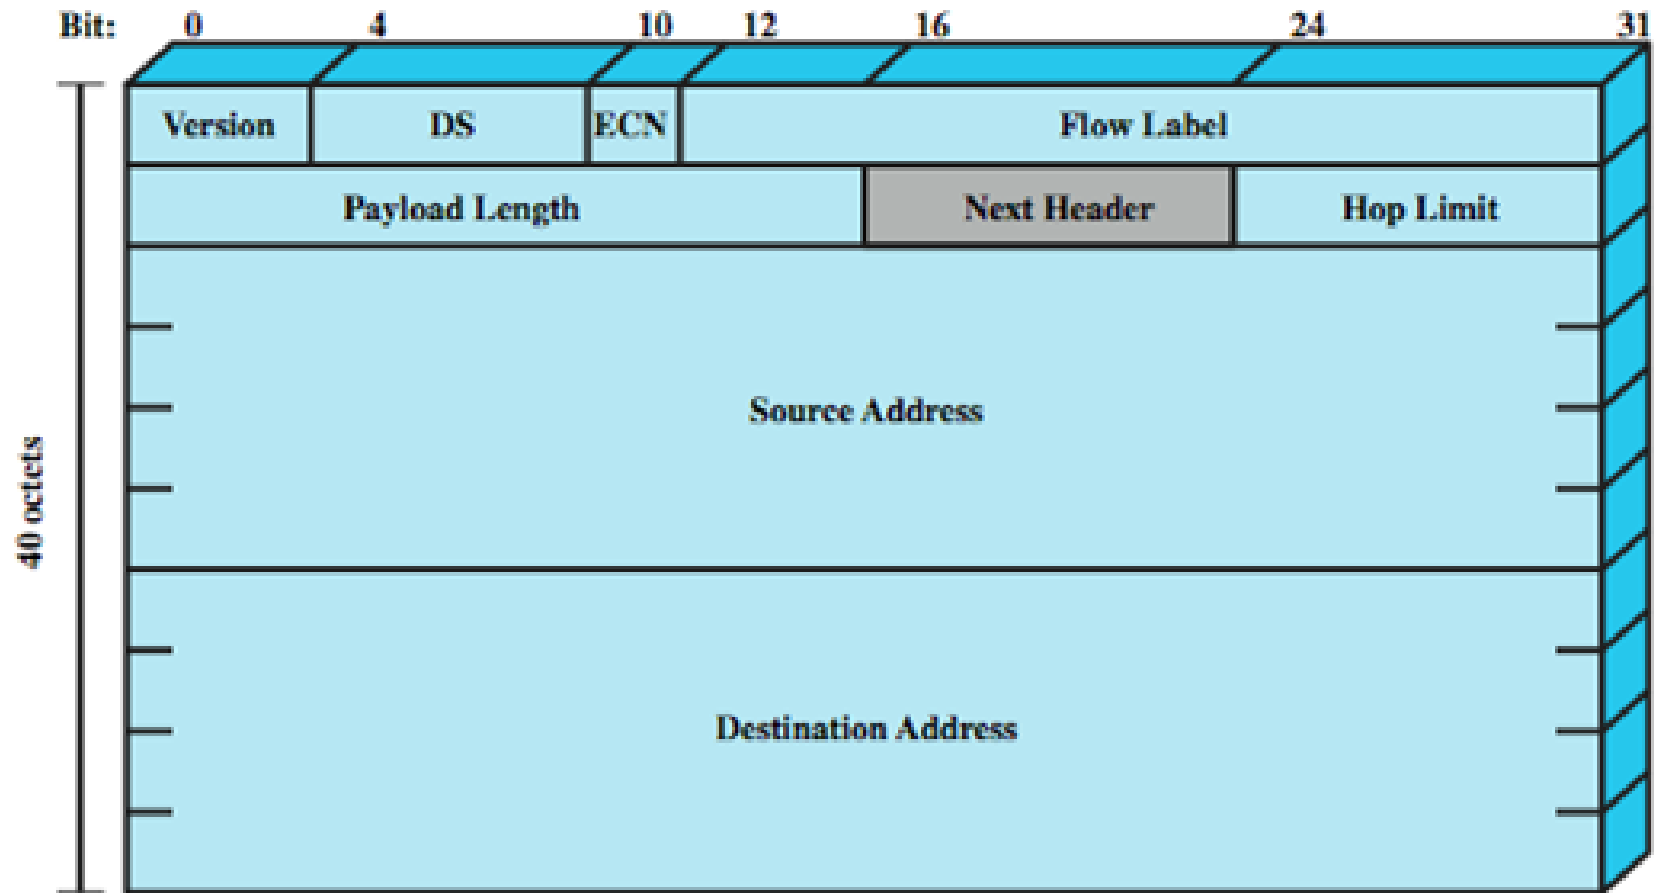

**(b) UDP Header**

# IPv6

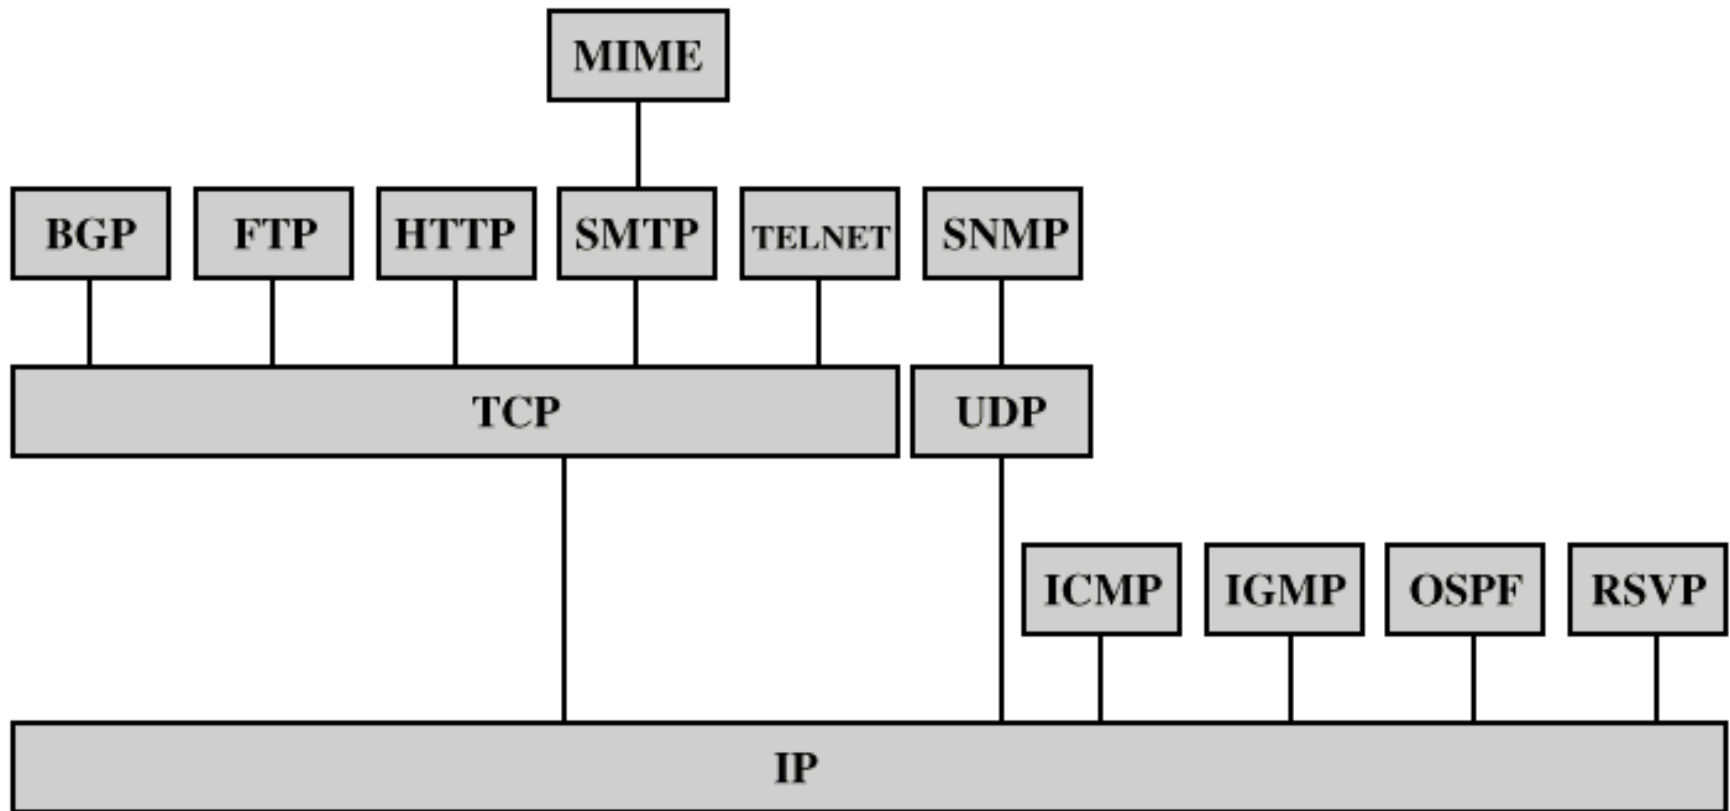

- Provides enhancements over existing IP
- Designed to accommodate higher speeds and the mix of graphic and video data
- Driving force was the need for more addresses due to growth of the Internet
- IPv6 includes 128-bit source and destination address fields

# IPv6 Header

(b) IPv6 Header

# TCP/IP Protocols

**BGP** = Border Gateway Protocol

**FTP** = File Transfer Protocol

**HTTP** = Hypertext Transfer Protocol

**ICMP** = Internet Control Message Protocol

**IGMP** = Internet Group Management Protocol

**IP** = Internet Protocol

**MIME** = Multi-Purpose Internet Mail Extension

**OSPF** = Open Shortest Path First

**RSVP** = Resource ReSerVation Protocol

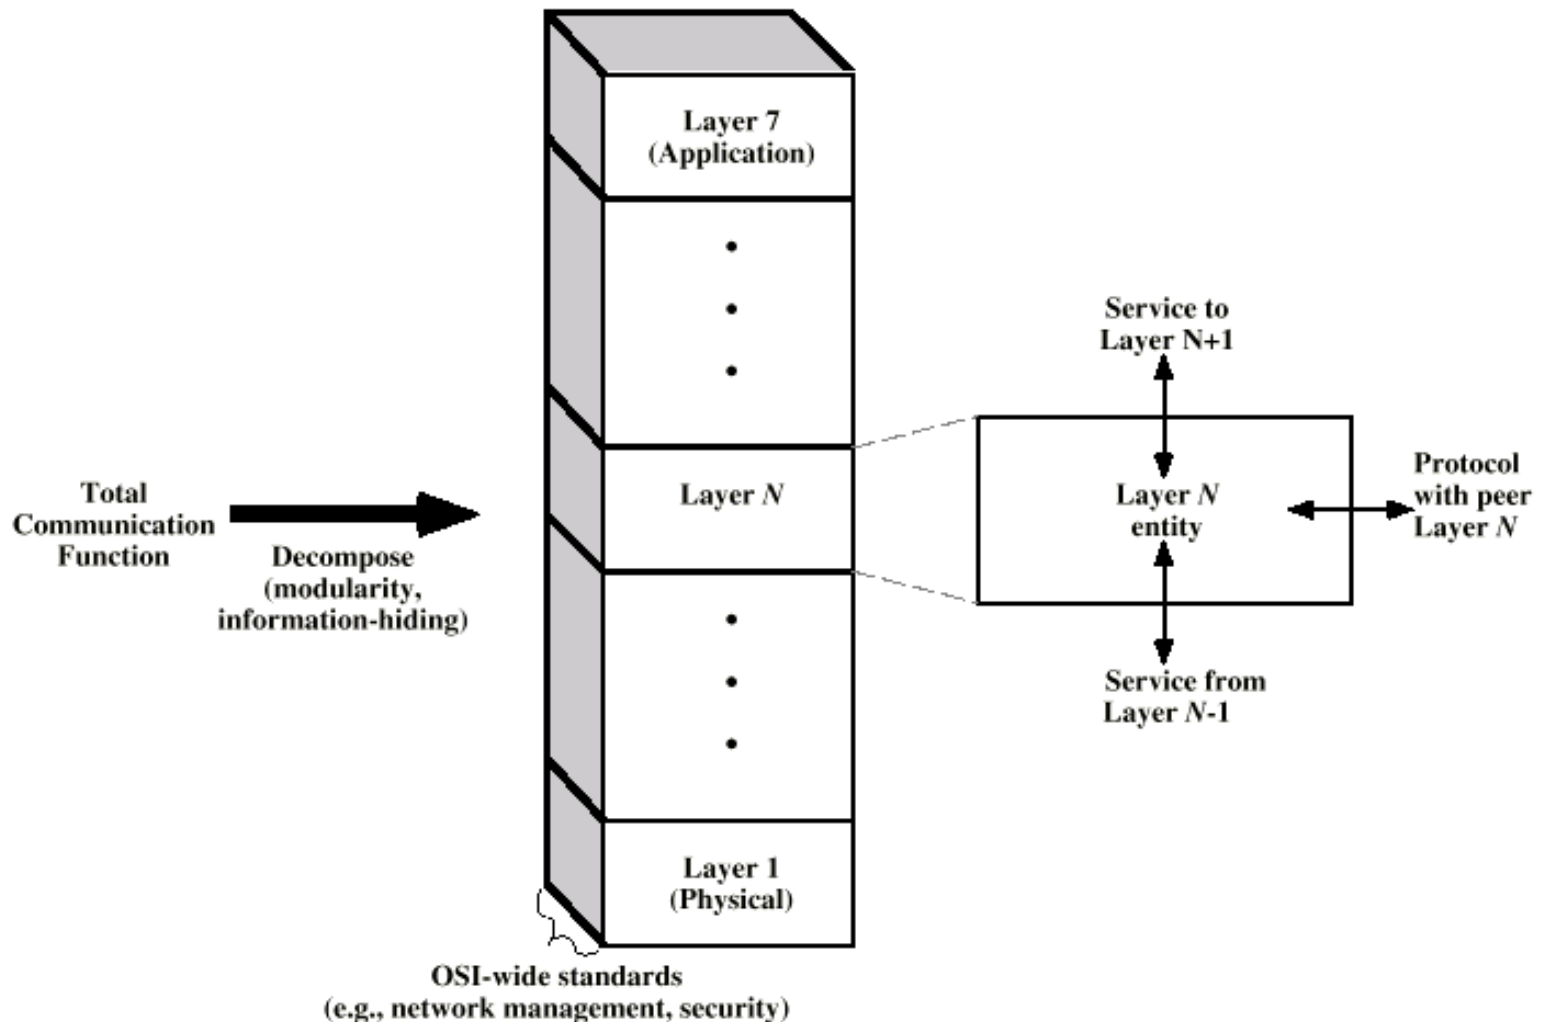

**SMTP** = Simple Mail Transfer Protocol

**SNMP** = Simple Network Management Protocol

**TCP** = Transmission Control Protocol

**UDP** = User Datagram Protocol

# Standardized Protocol Architectures

# Layer Specific Standards

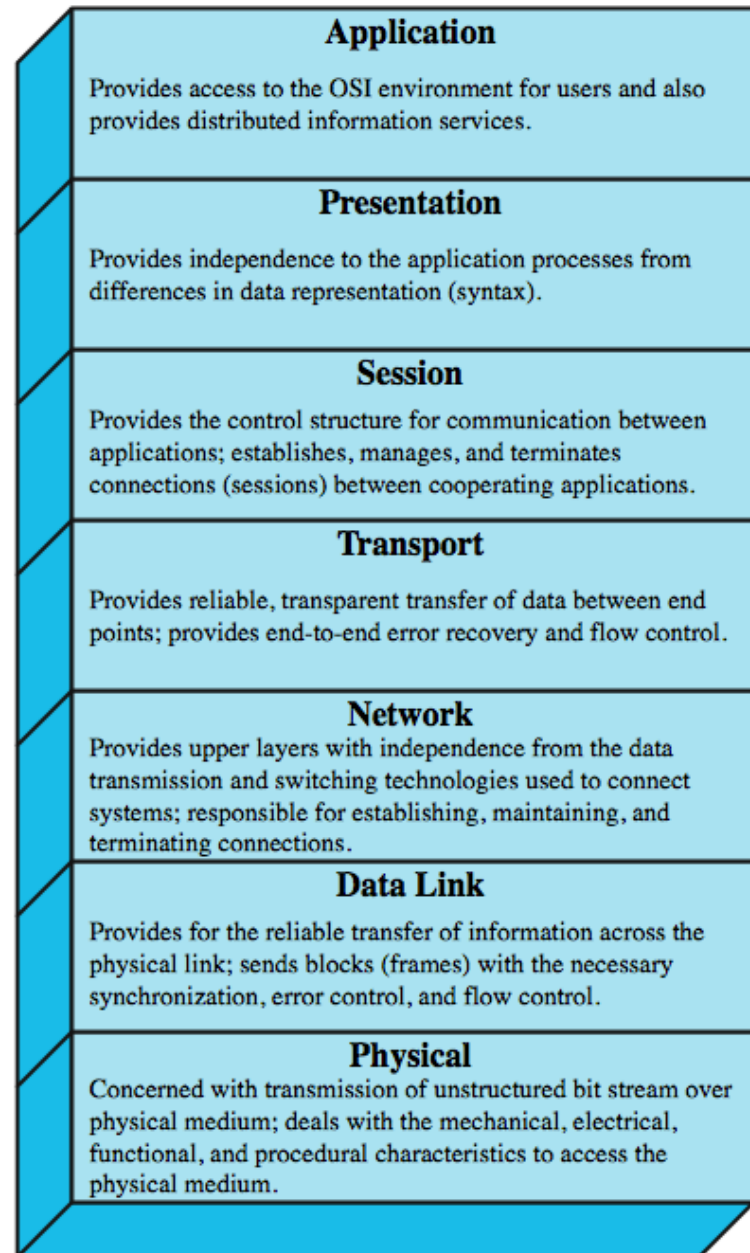

# OSI Standardization

- framework for standardization was motivator
- lower layers are concerned with greater levels of details
- each layer provides services to the next higher layer
- three key elements:

# OSI Layers

**Figure 2.6 The OSI Layers**

# OSI v TCP/IP

OSI	TCP/IP
Application	Application
Presentation	
Session	
Transport	Transport (host-to-host)
Network	Internet
Data Link	Network Access
Physical	Physical

# Internet Applications

Applications that operate on top of TCP include:

# Multimedia Terminology

## **Media**

Refers to the form of information and includes text, still images, audio, and video.

## **Multimedia**

Human-computer interaction involving text, graphics, voice and video. Multimedia also refers to storage devices that are used to store multimedia content.

## **Streaming media**

Refers to multimedia files, such as video clips and audio, that begin playing immediately or within seconds after it is received by a computer from the Internet or Web. Thus, the media content is consumed as it is delivered from the server rather than waiting until an entire file is downloaded.

# Multimedia Terminology

**audio** generally encompasses sounds that are produced by human, telephony and related voice communications technology

**image** supports the communication of individual pictures, charts, or drawings

**video** service carries sequences of pictures in time

**text** is information that can be entered via a keyboard and is directly readable and printable

# Multimedia Applications

## **Multimedia information systems**

- databases, information kiosks, hypertexts, electronic books, and multimedia expert systems

## **Multimedia communication systems**

- computer-supported collaborative work, videoconferencing, streaming media, and multimedia teleservices

## **Multimedia entertainment systems**

- 3D computer games, multiplayer network games, infotainment, and interactive audiovisual productions

## **Multimedia business systems**

- immersive electronic commerce, marketing, multimedia presentations, video brochures, virtual shopping

## **Multimedia educational systems**

- electronic books, flexible teaching materials, simulation systems, automatic testing, distance learning

# Domains of Multimedia Systems and Example Applications

Domain	Example Application
Information management	Hypermedia, multimedia-capable databases, content-based retrieval
Entertainment	Computer games, digital video, audio (MP3)
Telecommunication	Videoconferencing, shared workspaces, virtual communities
Information publishing/delivery	Online training, electronic books, streaming media

# Elastic and Inelastic Traffic

## Elastic Traffic

*can adjust to  
delay and  
throughput  
changes across  
an internet*

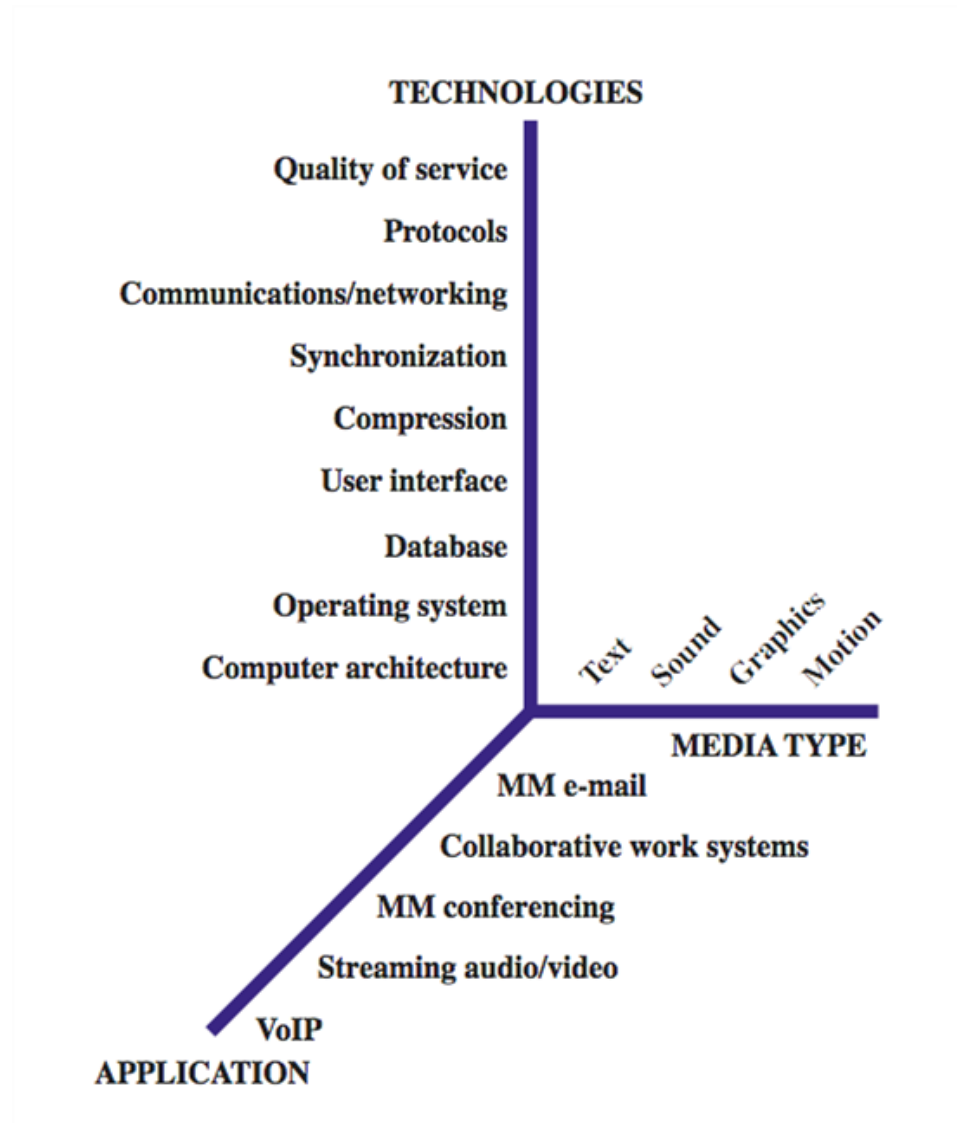

*-traditional  
“data” style  
TCP/IP traffic*

## Inelastic Traffic

*does not easily  
adapt to changes  
in delay and  
throughput*

*-“real-time”  
traffic such as  
voice and video*

# Multimedia Technologies

# Summary

- needs and key elements for protocol architecture
- TCP/IP protocol architecture
- OSI Model & protocol architecture standardization
- traditional versus multimedia application needs
